Feature List

Creating and reading proper documentation is an important skill for a developer. You should be able to write documentation that will allow any developer to start picking up work in your project.
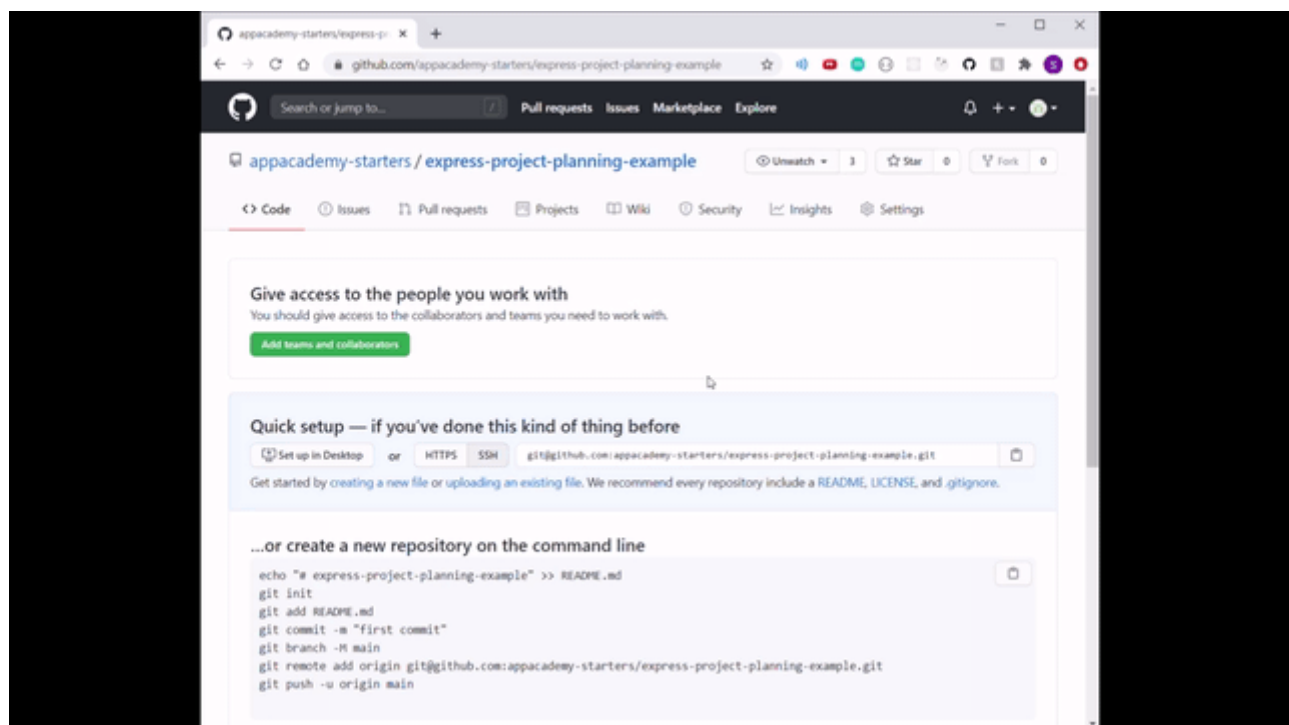

Once you have picked a project, spend time with your team figuring out the features that you want your application to have. To do this, you need to think about what features you need in a minimum viable product. The minimum viable product (MVP) is developing a product with the minimum amount of features to satisfy your first customers.

Ask yourselves the following:

- What features are needed to make this an application that people would use?
- What features would be nice to have if the minimum viable product gets finished?
- Will these features demonstrate everything we've learned during the first half of the course?

Try to create the feature list from the perspective of the person who will be using your application.

Start by creating a **Feature List** wiki page in your GitHub repository. Make sure to add a link to it in your wiki's Home page. In there, you can create the list of features and their estimates so that an instructor can review them.

Here's an example of a Feature List wiki page.

Get your Feature List Reviewed

Once your group is finished putting together the Feature List, send a link to the Wiki docs to your Project Advisor to get it reviewed. Make amendments to the Feature List when your Project Advisor is finished reviewing it.
